

## Laboratory Assignment 3

The screenshot shows a GitHub repository page for 'mp-cuda-performance-analyze'. The repository is public and was last updated 2 days ago. It contains several files and folders:

- elf**: [docs]: makefile, single\_thread, multi\_thread, n... (2 days ago)
- include**: [docs]: makefile, single\_thread, m... (2 days ago)
- src**: [docs]: makefile, single\_thread, m... (2 days ago)
- LICENSE**: [docs]: makefile, single\_thread, m... (2 days ago)
- README.md**: [docs]: makefile, single\_thread, m... (2 days ago)
- compile.sh**: [docs]: makefile, single\_thread, m... (2 days ago)

The repository has 0 stars, 0 forks, and 0 watching. The 'About' section describes it as a CUDA program and Custom Python Library, with links to Readme, MIT license, Activity, and releases.

```

## 1 Matrix Multiplication

A significant portion of the code was written by referencing `process_speed_check.cu`, which I had written previously.

[https://github.com/csian98/sian/blob/main/usages/process\\_speed\\_check.cu](https://github.com/csian98/sian/blob/main/usages/process_speed_check.cu)

```
csian@giovanni ~/projects/cuda $ ls
build      compile.sh    elf  include  LICENSE  matrix_multiplication.py  README.md
compile_flags.txt  convolution.py  img  lib      makefile  process_speed_check.cu  src
csian@giovanni ~/projects/cuda $ make all
make: Nothing to be done for 'all'.
csian@giovanni ~/projects/cuda $ |
```

All code can be compiled using the `makefile`, and the executable files will be stored in the `elf` directory.

```
csian@giovanni ~/projects/cuda/elf $ ls
convolution.elf  multi_thread    naive_cuda.elf    single_thread
cUBLAS.elf       multi_thread.elf  optimize_cuda.elf  single_thread.elf
csian@giovanni ~/projects/cuda/elf $ |
```

**CPU: single\_thread, multi\_threads**

```
csian@giovanni ~/projects/cuda/elf $ ./single_thread.elf
#####

```
(giovanni-python) csian@giovanni ~/projects/cuda $ python matrix_multiplication.py
Python call to CUDA library cost time: 0.1033
(giovanni-python) csian@giovanni ~/projects/cuda $ |
```

Using ctypes to call CUDA C++ code from Python

## 2 Image Convolution

Regarding the original image, after processing the grayscale uint8 data, image processing was performed on the 2048x2048 pixel image (center cropped).

```
(giovanni-python) csian@giovanni ~/projects/cuda $ python convolution.py
(giovanni-python) csian@giovanni ~/projects/cuda $ |
```

```
(giovanni-python) csian@giovanni ~/projects/cuda/img $ ls
edge_detection.png  original.png  sharpen.png
(giovanni-python) csian@giovanni ~/projects/cuda/img $ |
```

Image processing was performed using a 5x5 edge detection filter and a sharpen filter.

Although the edges are not clearly visible in the edge detection result due to the small filter size, when the contrast is adjusted to change the brightness and darkness, it can be confirmed that the edges are being extracted.
